

Edit the global php.ini file in Mac OSX

This article assumes that you are running an Mac based operating system, and that you have a dedicated server or VPS and have root access.

Connect to your host:

```
ssh your.hostname.com  
  
or  
  
ssh 111.111.111.111
```

Where 111.111.111.111 is your main server IP

The system will ask you for a user and password. The username is "root" (no quotes)

The password is the root password. You will now be connected to your server.

next type:

```
cd /usr/local/lib/  
  
then  
  
cp php.ini php.iniBACKUP
```

which makes a backup of the original file

Next type:

```
nano php.ini
```

You have now opened nano which is a Linux text editor.

Now you can modify the variables that you need.

When you are done press ctrl+x and when it asks if you want to save the modified buffer type "y" (no quotes needed) and press enter to save the new php.ini

Then type:

```
service httpd restart
```

This will load the new php configuration into Apache.
